SGD Algorithm to predict movie ratings

There will be some functions that start with the word "grader" ex: grader_matrix(), grader_mean(), grader_dim() etc, you should not change those function definition.

Every Grader function has to return True.

1. Download the data from [here (https://drive.google.com/open?id=1-1z7iDB52cB6_JpO7Dqa-eOYSs-mivpq)](https://drive.google.com/open?id=1-1z7iDB52cB6_JpO7Dqa-eOYSs-mivpq)

2. The data will be of this format, each data point is represented as a triplet of user_id, movie_id and rating

user_id	movie_id	rating
77	236	3
471	208	5
641	401	4
31	298	4
58	504	5
235	727	5

Task 1

Predict the rating for a given (user_id, movie_id) pair

Predicted rating $\hat{y}_{ij}$ for user i, movied j pair is calcuated as $\hat{y}_{ij} = \mu + b_i + c_j + u_i^T v_j$, here we will be finding the best values of b_i and c_j using SGD algorithm with the optimization problem for N users and M movies is defined as

$$L = \min_{b, c, \{u_i\}_{i=1}^N, \{v_j\}_{j=1}^M} \quad \alpha \Big(\sum_{j} \sum_{k} v_{jk}^2 + \sum_{i} \sum_{k} u_{ik}^2 + \sum_{i} b_i^2 + \sum_{j} c_i^2 \Big) + \sum_{i,j \in \mathcal{I}^{\text{train}}} (y_{ij} - \mu - b_i - c_j$$

- (\mu) : scalar mean rating
- (b_i) : scalar bias term for user (i)
- (c_j) : scalar bias term for movie (j)
- (u_i) : K-dimensional vector for user (i)

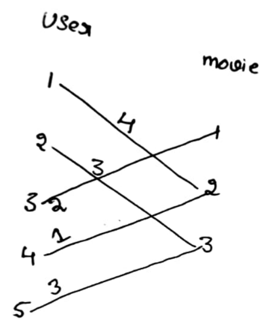
- (v_j) : K-dimensional vector for movie (j)

*. We will be giving you some functions, please write code in that functions only.

*. After every function, we will be giving you expected output, please make sure that you get that output.

Type *Markdown* and LaTeX: α^2

1. Construct adjacency matrix with the given data, assuming its [weighted un-directed bi-partited graph (https://en.wikipedia.org/wiki/Bipartite_graph)](https://en.wikipedia.org/wiki/Bipartite_graph) and the weight of each edge is the rating given by user to the movie



the Adjacency matrix

$$\begin{array}{c|ccc} & 1 & 2 & 3 \\ \hline 1 & 0 & 4 & 0 \\ 2 & 0 & 0 & 3 \\ 3 & 2 & 0 & 0 \\ 4 & 0 & 1 & 0 \\ 5 & 0 & 0 & 3 \end{array}$$

you can construct this matrix like $A[i][j] = r_{ij}$ here i is user_id, j is movie_id and r_{ij} is rating given by user i to the movie j

Hint : you can create adjacency matrix using [csr_matrix (https://docs.scipy.org/doc/scipy/reference/generated/scipy.sparse.csr_matrix.html)](https://docs.scipy.org/doc/scipy/reference/generated/scipy.sparse.csr_matrix.html)

2. We will Apply SVD decomposition on the Adjaceny matrix [link1 (https://stackoverflow.com/a/31528944/4084039)](https://stackoverflow.com/a/31528944/4084039), [link2 (https://machinelearningmastery.com/singular-value-decomposition-for-machine-learning/)](https://machinelearningmastery.com/singular-value-decomposition-for-machine-learning/) and get three matrices $U, \sum, V$ such that $U \times \sum \times V^T = A$,
   if A is of dimensions $N \times M$ then
   U is of $N \times k$,
   $\sum$ is of $k \times k$ and
   V is $M \times k$ dimensions.

*. So the matrix U can be represented as matrix representation of users, where each row u_i represents a k-dimensional vector for a user

*. So the matrix V can be represented as matrix representation of movies, where each row v_j represents a k-dimensional vector for a movie.

3. Compute μ , μ represents the mean of all the rating given in the dataset.(write your code in def m_u())
4. For each unique user initilize a bias value B_i to zero, so if we have N users B will be a N dimensional vector, the i^{th} value of the B will corresponds to the bias term for i^{th} user (write your code in def initialize())
5. For each unique movie initilize a bias value C_j zero, so if we have M movies C will be a M dimensional vector, the j^{th} value of the C will corresponds to the bias term for j^{th} movie (write your code in def initialize())
6. Compute dL/db_i (Write you code in def derivative_db())
7. Compute dL/dc_j(write your code in def derivative_dc()
8. Print the mean squared error with predicted ratings.

```
for each epoch:
    for each pair of (user, movie):
        b_i =  b_i - learning_rate  dL/db_i
        c_j =  c_j - learning_rate  dL/dc_j
predict the ratings with formula
```

$$\hat{y}_{ij} = \mu + b_i + c_j + \text{dot\_product}(u_i, v_j)$$

9. you can choose any learning rate and regularization term in the range 10^{-3} to 10^{2}
10. **bonus**: instead of using SVD decomposition you can learn the vectors u_i, v_j with the help of SGD algo similar to b_i and c_j

Task 2

As we know U is the learned matrix of user vectors, with its i-th row as the vector ui for user i. Each row of U can be seen as a "feature vector" for a particular user.

The question we'd like to investigate is this: do our computed per-user features that are optimized for predicting movie ratings contain anything to do with gender?

The provided data file user_info.csv (https://drive.google.com/open?id=1PHFdJh_4gIPiLH5Q4UErH8GK71hTrzlY) contains an is_male column indicating which users in the dataset are male. Can you predict this signal given the features U?

Note 1 : there is no train test split in the data, the goal of this assignment is to give an intution about how to do matrix factorization with the help of SGD and application of truncated SVD. for better understanding of the collabarative fillerting please check netflix case study.

Note 2 : Check if scaling of U, V matrices improve the metric

Reading the csv file

In [102]:
```
import pandas as pd
data1=pd.read_csv('ratings_train.csv')
data1.head()
```

Out[102]:

	user_id	item_id	rating
0	772	36	3
1	471	228	5
2	641	401	4
3	312	98	4
4	58	504	5

In [103]:
```
data1.shape
```

Out[103]: (89992, 3)

Create your adjacency matrix

In [104]:
```
from scipy.sparse import csr_matrix
import numpy as np
a=np.array(data1)
row = a[:,0]
col = a[:,1]
data = a[:,2]
adjacency_matrix=csr_matrix((data, (row, col))).toarray()# write your code of
```

In [105]:
```
adjacency_matrix.shape
```

Out[105]: (943, 1681)

Grader function - 1

In [106]:
```
def grader_matrix(matrix):
  assert(matrix.shape==(943,1681))
  return True
grader_matrix(adjacency_matrix)
```

Out[106]:
```
True
```

SVD decompostion

Sample code for SVD decompostion

In [107]:
```
from sklearn.utils.extmath import randomized_svd
import numpy as np
matrix = np.random.random((20, 10))
U, Sigma, VT = randomized_svd(matrix, n_components=5,n_iter=5, random_state=N
print(U.shape)
print(Sigma.shape)
print(VT.T.shape)
```

```
(20, 5)
(5,)
(10, 5)
```

Write your code for SVD decompostion

In [116]:
```
# Please use adjacency_matrix as matrix for SVD decompostion
# You can choose n_components as your choice
from sklearn.utils.extmath import randomized_svd
import numpy as np
# matrix = np.random.random((20, 10))
matrix=adjacency_matrix
U, Sigma, VT = randomized_svd(matrix, n_components=5,n_iter=5, random_state=N
print(U.shape)
print(Sigma.shape)
print(VT.T.shape)

```

```
(943, 5)
(5,)
(1681, 5)
```

Compute mean of ratings

In [43]:
```
data
```

Out[43]:
```
array([3, 5, 4, ..., 2, 5, 3], dtype=int64)
```

In [44]:
```
def m_u(ratings):
    '''In this function, we will compute mean for all the ratings'''
    # you can use mean() function to do this
    # check this (https://pandas.pydata.org/pandas-docs/stable/reference/api/
    ratings=ratings.mean()
    return ratings
```

In [45]:
```
mu=m_u(data1['rating'])
print(mu)
```

```
3.529480398257623
```

Grader function -2

In [46]:
```
def grader_mean(mu):
  assert(np.round(mu,3)==3.529)
  return True
mu=m_u(data1['rating'])
grader_mean(mu)
```

Out[46]:
```
True
```

Initialize B_i and C_j

Hint : Number of rows of adjacent matrix corresponds to user dimensions(B_i), number of columns of adjacent matrix corresponds to movie dimensions (C_j)

In [47]:
```
def initialize(dim):
    '''In this function, we will initialize bias value 'B' and 'C'.'''
    # initalize the value to zeros
    # return output as a list of zeros
    dim=[0 for i in range(dim)]

    return dim
```

In [48]:
```
len(data1['user_id'].unique())
```

Out[48]:
```
943
```

In [49]:
```
dim=943# give the number of dimensions for b_i (Here b_i corresponds to users
b_i=initialize(dim)
# print(b_i)
```

In [50]:
```
dim= 1681# give the number of dimensions for c_j (Here c_j corresponds to mov
c_j=initialize(dim)
```

Grader function -3

In [51]:
```
def grader_dim(b_i,c_j):
  assert(len(b_i)==943 and np.sum(b_i)==0)
  assert(len(c_j)==1681 and np.sum(c_j)==0)
  return True
grader_dim(b_i,c_j)
```

Out[51]: True

Compute dL/db_i

In [52]:
```
def derivative_db(user_id,item_id,rating,U,V,mu,alpha):
    '''In this function, we will compute dL/db_i'''
    pred_y = mu+b_i[user_id]+c_j[item_id]+np.dot(U[user_id],(V.T[item_id]))
    derivate_L_b=(alpha*(2*b_i[user_id]))+(-2*(rating-pred_y))
    return derivate_L_b

```

Grader function -4

In [53]:
```
def grader_db(value):
    assert(np.round(value,3)==-0.931)
    return True
U1, Sigma, V1 = randomized_svd(adjacency_matrix, n_components=2,n_iter=5, ran
# Please don't change random state
# Here we are considering n_componets = 2 for our convinence
alpha=0.01
value=derivative_db(312,98,4,U1,V1,mu,alpha)
grader_db(value)
```

Out[53]: True

Compute dL/dc_j

In [54]:
```
def derivative_dc(user_id,item_id,rating,U,V,mu):
    '''In this function, we will compute dL/dc_j'''
    pred_y = mu+b_i[user_id]+c_j[item_id]+np.dot(U[user_id],(V.T[item_id]))
    derivate_L_c=(alpha*(2*b_i[user_id]))+(-2*(rating-pred_y))
    return derivate_L_c

```

Grader function - 5

In [55]:
```
def grader_dc(value):
    assert(np.round(value,3)==-2.929)
    return True
U1, Sigma, V1 = randomized_svd(adjacency_matrix, n_components=2,n_iter=5, ran
# Please don't change random state
# Here we are considering n_componets = 2 for our convinence
r=0.01
value=derivative_dc(58,504,5,U1,V1,mu)
grader_dc(value)
```

Out[55]: True

Compute MSE (mean squared error) for predicted ratings

for each epoch, print the MSE value

```
for each epoch:

    for each pair of (user, movie):

        b_i =  b_i - learning_rate * dL/db_i

        c_j =  c_j - learning_rate * dL/dc_j

predict the ratings with formula
```

$\hat{y}_{ij} = \mu + b_i + c_j + \text{dot\_product}(u_i, v_j)$

In [56]:
```
user=data1['user_id'].values
movie=data1['item_id'].values
ratings=data1['rating'].values
```

In [57]:
```
import numpy as np
